Naturopathy and the Primary Care Practice

Sara A. Fleming, ND*, Nancy C. Gutknecht, ND

KEYWORDS
• Naturopathy • Nutrition • Botanical medicine • Homeopathy

NATUROPATHIC MEDICINE OVERVIEW

Naturopathy is a distinct type of primary care medicine that blends age-old healing traditions with scientific advances and current research. Naturopathy is guided by a unique set of principles that recognize the body’s innate healing capacity, emphasize disease prevention, and encourage individual responsibility to obtain optimal health (Box 1). The naturopathic physician (ND) strives to thoroughly understand each patient’s condition, and views symptoms as the body’s means of communicating an underlying imbalance. Treatments address the patient’s underlying condition, rather than individual presenting symptoms. Modalities used by NDs include diet and clinical nutrition, behavioral change, hydrotherapy, homeopathy, botanical medicine, physical medicine, pharmaceuticals, and minor surgery.1,2 Naturopathy can be traced back to the European “nature cure,” practiced in the nineteenth century, which was a system for treating disease with natural modalities such as water, fresh air, diet, and herbs. In the early twentieth century, naturopathy developed in the United States and Canada, combining nature cure, homeopathy, spinal manipulation, and other therapies (Fig. 1).3

NATUROPATHIC APPROACH TO HEALTH

In naturopathic theory, illness is viewed as a process of disturbance to health and subsequent recovery in the context of natural systems. Many things can disturb optimal health, such as poor nutrition, chronic stress, or toxic exposure. The goal of the ND is to restore health by identifying and minimizing these disturbances. To do this, the ND first recognizes the factors that determine health (Table 1). A determinant becomes a disturbance when it is compromised in some way.

In attempting to restore health, the ND follows a specific, yet adaptable, therapeutic order that begins with minimal interventions and proceeds to higher level interventions as necessary (Box 2). The order begins with reestablishing the conditions of health,
such as developing a more healthful dietary and lifestyle regime. Next, the body’s natural healing mechanisms may be stimulated through techniques such as hydrotherapy, which can increase the circulation of blood and lymph. The third step is to support weakened or damaged systems with homeopathy, botanical medicine, or specific exercises, such as yoga. The fourth step is to correct structural integrity, which is typically done with physical medicine techniques including massage and naturopathic manipulation. The fifth step is to address pathology using specific natural substances, such as dietary supplements. The sixth step is to address pathology using pharmaceutical or synthetic substances. Surgical correction is reserved for the final therapeutic step.4

CURRENT PRACTICE

Education

NDs are trained over 4 years at accredited doctoral-level naturopathic medical schools. Such schools have been experiencing significant increases in enrollment and graduating class sizes over the past 20 years, particularly since the year 2000.5 There are currently 7 naturopathic medical schools in the United States and Canada that are either accredited or are in candidate status for accreditation (Table 2). The range of didactic instruction at these schools is between 2580 and 3270 hours, and clinical instruction is between 1200 and 1500 hours.1,6

Accredited naturopathic medical schools must attain both regional and programmatic accreditation. Regional accreditation is through one of the US Department of Education–recognized regional associations of schools and colleges. Programmatic accreditation for all naturopathic medical schools in North America is through the Council on Naturopathic Medical Education (CNME). All accredited naturopathic medical schools are supported by the Association of Accredited Naturopathic Medical Colleges (AANMC), which acts to promote the naturopathic profession by ensuring rigorous educational standards.7,8

Candidates for admission to naturopathic medical school are required to hold a baccalaureate degree, and to have completed all standard premedical undergraduate course work prior to matriculation. The first 2 years of naturopathic medical education

focuses on basic and diagnostic sciences including anatomy, physiology, biochemistry, histology, pathology, embryology, neuroscience, immunology, pharmacology, physical and clinical diagnosis, and laboratory diagnosis. The final 2 years of naturopathic medical education focuses on clinical sciences and practicum. Course work specific to naturopathic medicine is woven throughout the program, which includes naturopathic theory, diet and nutrient therapy, botanical medicine, homeopathy, hydrotherapy, massage, naturopathic manipulation, therapeutic exercise, counseling, and case management. Some NDs receive additional training in related disciplines, such as midwifery, Oriental herbal medicine, or acupuncture. NDs may choose to specialize in certain populations, such as pediatrics, or certain modalities, such as homeopathy.

Fig. 1. Timeline of pioneers in naturopathic medicine. (Data from Kirchfeld F, Boyle W. Eclectic therapies. In: Nature doctors: pioneers in naturopathic medicine. Portland, Oregon: Medicina Biologica; 1994.)
There are a limited number of 1- to 2-year postdoctoral CNME-certified naturopathic residency programs available. At present, residency is not required for licensure except in Utah. Programs are extremely competitive, with an average of 350 to 400 new ND graduates in the United States per year, and only 30 to 40 openings. Most of these programs are offered through accredited naturopathic medical schools and affiliated clinics, although other opportunities are emerging. An Integrative Medicine Residency is available through several hospitals and clinics, which gives NDs the opportunity to collaborate with conventional medical practitioners. The naturopathic profession has a commitment to increase clinical training opportunities, including the availability of postdoctoral residencies. There is a common informal practice of mentorship in which a new graduate joins the practice of a senior ND.9

### Table 1
Determinants of health

| Inborn                                | Genetic makeup (genotype)                                      |
|                                      | Intrauterine/congenital                                      |
|                                      | Maternal exposures                                          |
|                                      | - Drugs                                                    |
|                                      | - Toxins                                                   |
|                                      | - Viruses                                                  |
|                                      | - Psychoemotional                                          |
| Maternal nutrition                   |                                                            |
| Maternal lifestyle                   |                                                            |
| Constitution—determines susceptibility|                                                            |
| Hygienic factors/lifestyle factors—how we live | Environment, lifestyle, psychoemotional, and spiritual health |
|                                      | - Spiritual life                                           |
|                                      | - Self-assessment                                          |
|                                      | - Relationship to larger universe                          |
| Exposure to Nature                   |                                                            |
|                                      | - Fresh air                                                |
|                                      | - Clean water                                              |
|                                      | - Light                                                    |
| Diet, nutrition, and digestion       |                                                            |
|                                      | - Unadulterated food                                       |
|                                      | - Toxemia                                                  |
| Rest and exercise                    |                                                            |
|                                      | - Rest                                                     |
|                                      | - Exercise                                                 |
| Socioeconomic factors                |                                                            |
|                                      | - Culture                                                  |
|                                      | - Loving and being loved                                   |
|                                      | - Meaningful work                                          |
|                                      | - Community                                                |
| Stress (physical, emotional)         |                                                            |
|                                      | - Trauma (physical/emotional)                              |
|                                      | - Illnesses: pathobiography                                |
|                                      | - Medical interventions (or lack of)                       |
|                                      | - Surgeries                                                |
|                                      | - Suppressions                                             |
|                                      | - Physical and emotional exposures, stresses, and trauma   |
|                                      | - Toxic and harmful substances                             |
|                                      | - Addictions                                               |

Licensing

The licensing of NDs is determined at the state or province level in countries that regulate the profession. At present, Alaska, Arizona, British Columbia, California, Connecticut, the District of Columbia, Hawaii, Idaho, Kansas, Maine, Manitoba, Minnesota, Montana, New Hampshire, Ontario, Oregon, Saskatchewan, Utah, Vermont, and Washington, the United States territories of Puerto Rico and the US Virgin Islands, as well as provinces in Australia and New Zealand, have licensing laws for NDs.\(^2\)

Licensing efforts for NDs are led by state organizations, and many currently unlicensed states are in various stages of the process toward licensure. Proximity to an already licensed state is a significant predictor of new licensure.\(^10\) To be eligible for licensure, an ND must have graduated from an accredited naturopathic medical school, and have passed the Naturopathic Physicians Licensing Examination (NPLEx). NPLEx follows the same standards as the National Board of Medical Examiners (for the USMLE), the National Board of Chiropractic Examiners, the National Board of Osteopathic Medical Examiners, and other health care professions.\(^11\)

Licensing laws for NDs increase public safety by ensuring consistency of education, professional standards, compliance with public health standards, appropriate regulation, and currency of continuing education. In states and territories that do not have ND licensing laws, there has been an emergence of unqualified practitioners who did not graduate from appropriately accredited naturopathic medical schools.

---

**Box 2**

**Naturopathic therapeutic order**

1. Establish the conditions for health
   - Identify and remove disturbing factors
   - Institute a more healthful regimen
2. Stimulate the healing power of nature (vis medicatrix naturae): the self-healing processes
3. Address weakened or damaged systems or organs
   - Strengthen the immune system
   - Decrease toxicity
   - Normalize inflammatory function
   - Optimize metabolic function
   - Balance regulatory systems
   - Enhance regeneration
   - Harmonize life force
4. Correct structural integrity
5. Address pathology: use specific natural substances, modalities, or interventions
6. Address pathology: use specific pharmacologic or synthetic substances
7. Suppress or surgically remove pathology

---

*From Zeff J, Snider P, Pizzorno JE. Section I: philosophy of natural medicine. The textbook of natural medicine, 3rd edition 2006;1(1); with permission.*
Licensure in all areas will protect patients by ensuring that the providers they choose have an education in safe practice of naturopathic medicine.7

**Scope of Practice**

NDs are trained as primary care physicians with an emphasis in natural medicine in ambulatory settings. Their scope of practice varies by state and territory, but generally consists of the diagnosis, prevention, and treatment of disease by stimulation and support of the body’s natural healing mechanisms. Standard diagnostic and preventive techniques used include physical examination, laboratory testing, and diagnostic imaging. NDs may employ additional laboratory tests and examination procedures for further evaluation of nutritional status, metabolic functioning, and toxicities. Treatment modalities used by NDs include diet and clinical nutrition, behavioral change, hydrotherapy, homeopathy, botanical medicine, and physical medicine. Depending on the state, NDs may also be licensed to perform minor office procedures and surgery, administer vaccinations, and prescribe many prescriptive drugs.12

**Insurance Credentialing**

An increasing number of insurance companies, unions, and state organizations are credentialing licensed NDs. NDs are not credentialed in the same manner as are medical doctors (MDs) and osteopaths (DOs), because the scope of practice of NDs is not uniform nationwide. The process is based on each state’s individual licensing laws and particulars of each company.7,12 Excessive standardization to cater to credentialing needs may be unfavorable to both NDs and their patients, as individualized care is fundamental to the profession. If the widespread credentialing of NDs is

undertaken, a balance between establishing tight practice regulations and allowing for individualized approaches may be necessary.\(^{13}\)

NDs have been licensed in Washington State since 1919, and credentialed since 1996. An epidemiologic study found that 1.6% of 600,000 enrollees from 3 major insurance companies in Washington filed claims for naturopathic services in 2002,\(^{14}\) compared with National Health Statistics Reports (NHSR) population-based use estimates of 0.2% for naturopathic services in 2002 and 0.3% in 2007. The increase in use from 2002 to 2007 was, in part, attributed to the increase in naturopathic licensure during that time.\(^{15}\) Although not a direct comparison, these findings suggest that licensing and credentialing NDs, as in Washington, increases the usage of naturopathic services.

**Naturopathic Profession**

At the beginning of 2006, there were 4010 licensed NDs in the United States and Canada. This figure represents a 91% increase from 2001.\(^{16}\) Distance from naturopathic school and population density account for more than 69% of the distribution of NDs, the same factors that predict the distribution of MDs.\(^{17}\) NDs typically work in private practice, but are also employed by hospitals, clinics, community health centers, universities, and private industry.\(^{1,2}\) For NDs in private practice in Washington State, an estimated 78.9% reported sharing their office with other providers. These sharers included other NDs (65.2%), acupuncturists (40.4%), massage therapists (40.4%), chiropractors (18.0%), MDs (13.7%), PhDs (6.8%), counselors (6.2%), registered nurses (5.0%), midwives (4.4%), and nutritionists (4.4%).\(^{18}\)

Within the licensed states of Washington and Connecticut, 75% of all visits to NDs were for chronic conditions, 20% were for acute conditions, and 5% were for wellness/preventive purposes. The most common complaints of patients seeking naturopathic care were fatigue, headache, musculoskeletal problems, anxiety/depression, menopausal symptoms, bowel and abdominal problems, allergies, and rash. The most common pediatric visits in Washington were for health supervision (27.4% of visits), infection (20.6% of visits), and mental health conditions (12.7% of visits). The majority of patients seen were middle-aged Caucasian women. Children were seen in 10.2% to 12.8% of visits, and individuals older than 65 years were seen in 7.8% to 9.7% of visits.\(^{19–21}\)

More than 70% of ND visits in Washington and Connecticut included physical examination or ordering laboratory/diagnostic tests. The most common examinations were vitals (28%–39% of visits), HEENT (15%–18% of visits), and complete physical (9%–13% of visits). The most frequent laboratory tests were complete blood panels and serum chemistries, which were ordered in 7% to 10% of visits. Other laboratory tests were ordered less frequently and included thyroid panels, lipid panels, allergy tests, stool analyses, urine analyses, vitamin/mineral tests, endocrine, allergy skin tests, and tuberculosis skin tests. Diagnostic imaging, including radiography and ultrasound, was ordered in 1% to 2% of visits. The most common treatments used were botanical medicine (43%–51% of visits), vitamins (41%–43% of visits), minerals (35%–39% of visits), therapeutic diet (26%–36% of visits), homeopathy (19%–29% of visits), and self-care education (17%–23% of visits). Modalities used less frequently included allergy treatment, acupuncture, glandular therapies, manipulation, exercise therapy, hydrotherapy, physiotherapy, mechanotherapy, ultrasound, and mental health counseling. Four percent of all visits included a referral to an MD, and 1% to 2% included a referral to another type of practitioner. The average visit lasted 40 minutes.\(^{19}\) In pediatric visits in Washington, NDs administered
immunizations during 18.6% of health supervision visits for children younger than 2 years, and during 27.3% of visits for children aged from 2 to 5 years.\textsuperscript{18}

\section*{NATUROPATHIC MODALITIES}

\textit{Diet and Clinical Nutrition}

\textit{“Let food be thy medicine and medicine be thy food” — Hippocrates.} Proper nutrition is the foundation of a naturopathic practice, and food is used for both health promotion and disease prevention. NDs recommend diets individualized to each patient, though typically this means a balanced whole foods diet rich in fruits, vegetables, whole grains, legumes, wild-caught fish, lean animal proteins, and whole dairy products. To maximize nutritional value and minimize environmental impact, foods are considered best in their natural state, obtained locally, and eaten seasonally. NDs recognize how difficult and complex dietary changes may be, and assist patients through these changes by providing specific individualized recommendations, as well as educational materials and resources.

There is overwhelming evidence that unhealthy eating habits significantly increase the risks for morbidity and mortality. The Center for Disease Control and Prevention (CDC) determined that poor diet and physical inactivity caused 15.2\% of all deaths in the United States in the year 2000, and may soon overtake tobacco as the leading cause of death.\textsuperscript{22} It has been estimated that better nutrition could reduce the costs of heart disease, cancer, stroke, and diabetes by an estimated $71 billion each year.\textsuperscript{23} Obesity is also at an unprecedented high in the United States. In 2009, the CDC reported that 66\% of American adults, 17\% of children age 12 to 19, and 19\% of children age 6 to 11 years are overweight or obese.\textsuperscript{24} The general dietary recommendations and follow-up strategies that NDs use with their patients could have a significant impact on both chronic disease and obesity. It has been well established that diets high in fruits and vegetables are associated with decreased risk for chronic disease.\textsuperscript{25} In addition, fruits and vegetables are generally low in calories, thereby supporting healthy weight management.\textsuperscript{26} NDs may also prescribe special diets such as the elimination diet, anti-inflammatory diet, and hypoallergenic diet. These diets have a long history of traditional use in naturopathic practice, but more research is needed in these areas to better determine clinical indications and efficacy. In one such study, the elimination diet was found to ameliorate clinical signs of inflammation in patients with rheumatoid arthritis (RA), and augment the beneficial effect of fish oil supplementation.\textsuperscript{27}

The ultimate goal of naturopathic medicine is to optimize wellness by encouraging a healthy diet and lifestyle, but NDs may prescribe nutritional supplements if a specific deficiency is found or for certain conditions.\textsuperscript{28} Studies have shown not only the benefits of nutritional supplementation in promoting health and preventing disease, but also the potential health care cost savings. One such study found the daily use of multivitamins containing folic acid and zinc by all women of childbearing age, and the daily use of vitamin E by those older than 50 years could save nearly $20 billion annually in hospital charges related to heart disease, birth defects, and low weight premature births.\textsuperscript{29} There is much ongoing research in the area of nutritional supplements at both conventional and naturopathic institutions.\textsuperscript{30}

\section*{Behavioral Change}

NDs emphasize that to live healthily, one must work at it daily. Support is offered by NDs in the form of basic counseling, lifestyle modification, hypnotherapy, meditation, biofeedback, and stress management. NDs may also lead group classes in lifestyle modifications and stress management, helping foster community and connectedness
for patients and physicians as they share and gain knowledge together. This holistic
approach to healing acknowledges the importance of treating patients in the totality
of their mind, body, and spirit. For NDs, it is essential to spend quality time listening
to the patient to gain an understanding of how they live and to strengthen the physi-
cian-patient relationship. There is overwhelming evidence that effective physician-
patient communication is associated with improved patient health outcomes.31,32

A review of mindfulness research concluded that cultivating an enhanced mindful
approach to living is associated with decreases in emotional distress, increases in
positive states of mind, and an improvement in quality of life. Mindfulness practice
was also found to positively influence the brain, the autonomic nervous system, stress
hormones, the immune system, and health behaviors, including eating, sleeping, and
substance use.33 Additional information about mindfulness research is offered in
another article of this issue.

**Hydrotherapy**

Hydrotherapy is the external or internal use of water in any of its forms (water, ice,
steam) for health promotion or treatment of disease. Hydrotherapy was used widely
in ancient cultures, including Egypt, Persia, China, India, and Israel, before it was
well established as the traditional European water cure.34 Many of the treatments
can be applied at home, making them cost effective and participatory for the patient.

Numerous studies have examined potential immunomodulatory effects of hydro-
therapy treatments, with promising results. A study testing the immune effects of
cold water therapy in cancer patients found statistically significant increases in white
blood cell counts including neutrophils, lymphocytes, and monocytes, in subjects post
treatment compared with pretreatment values.35 In another study, repeated cold
water stimulations in patients with chronic obstructive pulmonary disease (COPD)
reduced the frequency of infections, increased lymphocyte counts, modulated
interleukin expression, and improved subjective well-being.36

Numerous studies have also evaluated various hydrotherapy techniques for the
treatment of specific conditions such as RA, osteoarthritis, wound management,
hemorrhoids, varicose veins, and chronic heart failure.37–41 Hydrotherapy was gener-
ally found to be beneficial and safe for these conditions, but broad conclusions are not
warranted due to sample size limitations and inconsistent methodologies. A meta-
analysis of hydrotherapy for the treatment of fibromyalgia syndrome found moderate
evidence that hydrotherapy has short-term beneficial effects on pain and health-
related quality of life (HRQOL).42 A recent Cochrane review on nasal saline irrigations
for chronic rhinosinusitis found evidence that nasal lavage relieves symptoms, helps
as an adjunct to treatment, and is well tolerated by most patients. There were no
significant side effects reported.43 More research on hydrotherapy is indicated due
to the promising preliminary findings in these areas.

**Homeopathy**

Homeopathy is a healing system that was created more than 200 years ago by
a German physician, Samuel Hahnemann. Homeopathy is based on a central theory
known as The Similia Principle. Substances made from plants, minerals, or animals,
which are known to cause symptoms similar to a certain disease, are given to patients
in an extremely diluted form. Homeopathic remedies are believed to stimulate autor-
egulatory and self-healing processes.44 Remedies are selected by matching
a patient’s symptoms, based on taking a finely detailed history, with symptoms
produced by the substances in healthy individuals. Homeopathy is extensively used
worldwide by homeopaths, MDs, DOs, NDs, and veterinarians. Across Europe,
approximately a quarter of the population uses homeopathy, and depending on the country, from 20% to 85% of all general practitioners either use homeopathy in their practices or refer their patients to homeopaths.\textsuperscript{45}

There are more than 200 clinical trials testing the efficacy of homeopathic treatments, many of which have led to positive results. However, an inconsistency in methods, limitations in sample sizes, as well as a lack of testing for single conditions restricts pooling these results. A review evaluated the effectiveness of homeopathy in the fields of immunoallergology and common inflammatory diseases. The evidence collectively demonstrates that in some conditions homeopathy shows significant promise, for example, \textit{Galphimia glauca} for the treatment of allergic oculorhinitis. Classic individualized homeopathy showed potential for the treatment of otitis, fibromyalgia, and possibly upper respiratory tract infections and allergic complaints. A general weakness of the evidence is scarcity of independent confirmation of reported trials and conflicting results. The investigators concluded that, considering homeopathic medicines are safe, they are a possible treatment option for upper airway infections, otitis, allergic rhinitis, and asthma.\textsuperscript{46}

Several other clinical trials on homeopathic medicines show promise as well. One trial evaluated homeopathic medicines for minimizing the adverse effects of cancer treatments, and found preliminary data in support of the efficacy of topical calendula ointment in the prevention of radiotherapy-induced dermatitis, and Traumeel S mouthwash for chemotherapy-induced stomatitis. The medicines did not cause any serious adverse effect or interact with conventional treatment.\textsuperscript{47} A Norwegian multicenter outcomes study found that 7 out of 10 patients visiting a homeopath reported a meaningful improvement in their main complaint 6 months after the initial consultation.\textsuperscript{48} Given these positive findings, as well as the rich history and widespread use of homeopathy, further research in this area is indicated.

\textbf{Botanical Medicine}

Traditional medicine has been used in communities for thousands of years. According to the World Health Organization, herbal treatments are the most popular form of traditional medicine.\textsuperscript{49} In developing countries, 80% of the population depends exclusively on medicinal plants for primary health care.\textsuperscript{50} NDs use herbal preparations in the form of teas, tinctures, poultices, balms, baths, elixirs, compresses, oils, syrups, suppositories, and capsules. NDs prescribe and prepare herbal remedies based on the uniqueness of each patient and their presenting symptoms. Organic and wild harvested herbs are used if available. A growing body of research supports the efficacy and safety of various herbs for preventing and treating many health conditions.\textsuperscript{7}

A Cochrane review of herbal medicine for low back pain found strong evidence that \textit{Harpagophytum procumbens} (devil’s claw) reduced pain better than placebo, and moderate evidence that \textit{Salix alba} (white willow bark) and \textit{Capsicum frutescens} (cayenne) reduced pain better than placebo in short-term trials. However, the investigators reported that the quality of reporting in these trials was generally poor, and that additional trials testing these herbal medicines against standard treatments are needed, particularly for long-term use.\textsuperscript{51} In another Cochrane review, \textit{Crataegus laevigata} (hawthorn leaf, flower and fruit) extract was found to provide a significant benefit in symptom control and physiologic outcomes as an adjunctive therapy for chronic heart failure. All 14 trials included in the review were double-blind, placebo-controlled randomized controlled trials (RCTs).\textsuperscript{52} A Cochrane review of \textit{Hypericum perforatum} (St John’s wort) for the treatment of depression concluded that \textit{Hypericum perforatum} extracts: (a) are superior to placebo in patients with major depression; (b) are similarly effective as standard antidepressants; and (c) have fewer side effects than standard
antidepressants. All studies included were double-blind RCTs. However, the association of country of origin and precision with effects sizes complicated the interpretation. The use of dietary supplements and primary care is explored further in another article of this issue.

**Naturopathic Physical Medicine**

Since the founding of naturopathy in the early twentieth century, physical medicine modalities have been an integral component of naturopathic treatments. Naturopathic physical medicine is the therapeutic use of physiotherapy, therapeutic exercise, massage, energy work, naturopathic manipulation, and hydrotherapy. This practice is distinct from that of chiropractic, physical therapy, and physical rehabilitation. Although it encompasses a broad range of treatment modalities, most are used for musculoskeletal conditions, such as injury and pain.

Research on naturopathic physical modalities is limited, results have been inconsistent. A systematic review of low-intensity pulsed ultrasonography for the healing of fractures concluded that, although overall results are promising, the evidence is moderate to low in quality and provides conflicting results. The investigators recommend large, blinded trials, directly addressing patient-important outcomes, such as return to function. A Cochrane review of therapeutic ultrasound for treating patellofemoral pain syndrome determined that no conclusion could be made due to poor reporting of the therapeutic application of the ultrasound and low methodological quality of the trials included. A Cochrane review of transcutaneous electrical nerve stimulation (TENS) for chronic pain produced similarly questionable results. The investigators reported that published literature on the subject lacks the methodological rigor needed to make confident assessments of the role of TENS in chronic pain management, and that large multicenter RCTs of TENS are needed.

**NATUROPATHIC RESEARCH**

Much complementary and alternative (CAM) research to date has focused on single modalities, specific supplements, and particular constituents of herbs. This type of research is taken out of context of the larger CAM medical system in which it is actually used. The optimal research model used for evaluating naturopathic interventions must allow for individualized, multifaceted treatment strategies and potentially synergistic effects. Whole systems research (WSR) is an emerging research paradigm that may provide a better assessment of CAM therapies than classic RCTs, which attempt to determine the single best treatment for all patients. The goal of WSR is to evaluate treatments, products, specific modalities, and techniques within the context of the unique medical system in which they are used. Fundamental to WSR is developing appropriate study designs and analysis strategies for whole systems of medicine, recognizing the individuality of treatments and the participatory role of patients, emphasizing the health care environment and physician-patient interactions, including outcome measures based on patient-held values and individualized end points, and further developing a common understanding of the CAM models being studied. WSR is nonhierarchical, cyclical, adaptive, and holds qualitative and quantitative methods in equal esteem.

The Naturopathic Medical Research Agenda was a National Center for Complementary and Alternative Medicine (NCCAM)-funded project spanning from 2002 to 2004, which developed recommendations for the direction and emphasis of naturopathic research through 2010. Participants included more than 1200 individuals, representing a range of scientific and clinical backgrounds from leading
naturopathic faculty to conventional physician scientists. Two priority populations were identified during these sessions, type 2 diabetes and elderly life stage. For both of these populations, the goal is to compare naturopathic medical care to conventional care in large controlled trials. Specific approaches to naturopathic research were also identified, which include: (1) design and implement whole-practice research protocols focusing on naturopathic medicine as a primary care practice for both prioritized populations; (2) continue to research components of naturopathic medicine to include single agents for a specified diagnosis and mechanism of action studies; and (3) perform contextual research through observational studies, and study aspects of the practice of naturopathic medicine such as the patient-practitioner interaction and its integration with the larger medical system.59 Participating naturopathic medical schools are in the process of performing this research, and studies are at various stages of completion.1,60,61

There are several other current research projects, both federally and privately funded, at naturopathic medical schools in the United States and Canada. The NCCAM and The Canadian Institutes of Health Research (CIHR) are substantial funding agencies for these projects. Examples of current research include a matched controlled outcomes study comparing integrated care to conventional care for the treatment of cancer (Bastyr University and Fred Hutchinson Cancer Research Center), a pilot study evaluating the effects of magnet therapy for carpal tunnel syndrome (National College of Naturopathic Medicine), and a pragmatic randomized clinical trial of naturopathic medicine’s ability to treat and prevent cardiovascular disease (Canadian College of Naturopathic Medicine).1,60,61

INTEGRATIVE PATIENT CARE

Goals of naturopathic medicine parallel those of family medicine in providing for and maintaining the well-being of both the patient and the health care system as a whole. Collaboration between conventional and naturopathic communities is growing as state licensing and insurance credentialing expands, and as the general public becomes more knowledgeable about CAM therapies.62,63 Patients are increasingly seeking out NDs for many reasons, including wanting a holistic approach that addresses the root of the problem, wanting more time and attention, having not been helped by conventional care, and having had a previous positive experience with an ND.64 Many of the conditions for which patients see licensed NDs are the same as the conditions for which they see conventional physicians.20 For those who choose integrative medicine, comanagement of care and referral mechanisms will ensure optimally safe and effective patient care for several reasons. NDs are trained in potential drug/herb interactions and can provide educational support to patients and physicians. Naturopathic care may also reduce the need for some prescriptive drugs, and collaboration between the prescribing physician and the ND will be critical in determining medication dosing. NDs can also offer nutritional support around surgery and other procedures to reduce recovery time and potential complications. NDs are well trained in identifying potentially life-threatening situations and medical conditions that are beyond their scope of practice. Collaborative referral systems would provide continuity of care, comprehensive treatment, and optimal long-term patient management.

There are several integrative clinics nationwide that employ both NDs and MDs, and at least 20 hospitals that staff NDs. One such integrative clinic is Cedarburg Women’s Health Center, located in Cedarburg, Wisconsin. The clinic was established by Janice Alexander, MD to provide primary care with prevention at the forefront. Michele Fleming & Gutknecht
Nickels, ND joined the practice to offer patients an integrative approach to health. The collaboration has been beneficial to both the patients and physicians involved. Patients have seen that both types of medicine are needed for optimal health, and that each philosophy of medicine needs to be practiced by specialists. Dr Alexander has experienced how knowledgeable NDs are regarding primary care, and has seen substantial results from naturopathic treatments in her patients. Dr Nickels respects the expertise of Dr Alexander, and has significantly benefited from her mentorship. Discussion of patient cases has been mutually beneficial. Their patients agree that this type of medical care is at the forefront of primary care medicine.

Dr Nickels also runs a private practice, Integrative Family Wellness Center, located in Brookfield, Wisconsin. The clinic offers conventional family medicine as well as naturopathic medicine, chiropractic care, acupuncture, and manual therapy. Because of their holistic approach to health care and the additional time and attention provided to patients, the clinic has doubled in size in 1 year. Dr Nickels emphasizes that patients want this type of primary care, and envisions health care moving in this direction as people become more educated and demand having a choice of treatment options (permission from Michele Nickels, July 2009).

Another integrative clinic, located in Lokahi, Hawaii, is a partnership between Lokahi Health Center, the private practice of Michael Traub, ND, and Pacifica Integrative Skin Wellness Institute, the dermatologic private practice of Monica Scheel, MD. There is much mutual referral between the 2 businesses. Dr Traub’s patients have access to the expertise of a board-certified dermatologist, and Dr Scheel’s patients have access to NDs who can address concerns that go beyond their dermatologic conditions (permission from Michael Traub, July 2009).

RESOURCES

For more information, patients and physicians can go to the American Association of Naturopathic Physicians, the national association for licensed NDs, at http://www.naturopathic.org/. Additional local resources may be obtained from state naturopathic associations. The Web sites of accredited naturopathic medical schools (see Table 2) provide information specific to naturopathic education. There are also several texts that offer information on the practice of naturopathic medicine and its related modalities (Box 3). Key clinical recommendations are listed in Table 3.
